

Number One Travel & Tourism

نمبرون للسفر و السياحة

What has been built so far, how it was verified, and what the next stage depends on. Three foundation stages are complete and live. Nothing that touches the customer waits on code. Everything that waits, waits on business information.

STATUS	LIVE SITE	REPOSITORY · BRANCH	LATEST COMMIT
● Live · foundation com	mashhorfoods.gith ub.io/mashhor- demo	mashhorfoods/mash hor-demo claude/awesome- feynman-zyfjar	e6a0503 · Pages build passed

How we got here

Each stage was delivered from a written brief, verified in a real browser at phone, tablet and desktop widths in both languages, then reviewed for maintainability before the next stage started.

15 Sep	Stage 10.1 · Master foundation Design tokens, typography, grid, buttons, forms, cards, icons, search architecture, status and loading states, RTL-first layout, style guide, documentation.
15 Sep	First maintainability review · stages A–C Three defects fixed, dead code and duplicate implementations removed, the unused Latin-extended subset of Inter dropped (336 KB).
15–16 Sep	Deployment Site moved to the repository root, routes made independent of the deploy path, GitHub Pages serving from this branch, a branded 404 page added. The older single-page site that lived in this repository was removed.

16 Sep	Official logo installed Brand colours sampled from the supplied artwork. Four logo variants, favicon, Apple touch icon and social-share image generated from it.
16 Sep	Stage 10.2 · Global header and navigation Desktop, tablet and mobile headers; services, destinations, offers and help menus; global search; account entry; one Book Now action; mobile drawer.
16 Sep	Stage 10.3 · Global footer Three footer variants for marketing, booking and app pages; contact, social and legal structure that renders only verified values.
16 Sep	Second maintainability review · stages A–D A header listener leak closed, the help panel built once instead of twice, superseded code removed, unused Stage 11 scaffolding dropped.
16 Sep	Language completeness rule Every page fully translated in both directions, enforced by an audit that ships with the repository.

What is built

A static site with no build step. Plain layered CSS, native JavaScript modules, all navigation and content shapes held as data so later stages and an admin panel can supply them.

Brand

assets/brand

- Official logo in four variants: with and without descriptor, on light and dark surfaces.
- Identity red `#FE0002` sampled from the artwork, used for fills only; interface red `#E00000` passes AA for text on white.
- Favicon, Apple touch icon and 1200×630 share image generated from the original.

Design tokens

01-tokens.css

- Colour ramps for red and cool grey, applied roles for surface, text, border, status.
- 14-step type scale covering Arabic, Latin and booking data.
- Spacing, radius, shadow, motion and breakpoint tokens. No hex, px or duration is written in a component.

Components

05–09 · ui.js · cards.js

- Buttons: 7 variants × 8 states. Forms: 12 field types × 7 states including OTP and upload.
- Cards: 6 types in one visual language. Status: 7 states, always icon plus word.
- Loading, error and empty states with a required next action. 58 icons in one sprite.

Footer

footer.js · footer.js data

- Services column derived from the header's own menu, so the two cannot disagree.
- Real accordions on phones, plain headings on desktop, re-rendered at the breakpoint.
- Contact, social and legal rows exist in code but appear only once a value is supplied.

Pages

- **Home** — the foundation entry page with the live header and footer.
- **Style guide** — the living reference for every token and component, in both languages.
- **404** — branded, offers the services and a way home.

Verification

Every figure below was produced by an automated browser run against the current commit, at 390, 834 and 1440 pixel widths, in both Arabic and English.

Header

header.js · navigation.js

- Five primary items; services live in a mega menu with 12 lines across 4 groups.
- 11 destinations, 5 offer entries, help menu, WhatsApp and phone channels.
- Click-only menus, keyboard and Escape handling, scroll state without a scroll handler, booking variant.

Languages

core/il8n.js ·
tools/il8n-audit.mjs

- Arabic default, English by one click. Direction flips through logical CSS, no RTL stylesheet.
- Interface strings in one bilingual table; content records carry both languages.
- Audit loads every page in both locales and fails if any text, label, title or description is left in the wrong language.

Documentation

docs/

- `FOUNDATION.md` — architecture, tokens, rules, acceptance criteria, open items.
- `NAVIGATION.md` and `FOOTER.md` — how to mount, decisions and why, acceptance.
- Brand README recording the logo provenance and what is still wanted.

CHECK	COVERS	RESULT	STATE
Site suite	Tokens, grid, components, states, both directions, three widths	96 / 96	● pass
Header interaction	Menus, keyboard, Escape, outside click, one panel at a time	17 / 17	● pass
Header responsive	Bar compositions, drawer, one red action, no horizontal overflow	42 / 42	● pass
Footer	Variants, accordions, order, landmarks, focus, invented data impossible	62 / 62	● pass
Language audit	Home, style guide, 404 · text, labels, title, description · both locales	0 untranslated	● pass
Console	Page errors and console errors during load and locale switch	0	● pass
GitHub Pages build	Latest commit on the branch	#269	● success

Where we stand

The codebase is ready for the first product stage. The items in the middle column are values, not features. Each one is a single edit in a data file, and the layout already reserves its place.

Done and live

● complete

- Design system, component library and style guide.
- Global header, navigation and footer on every page.
- Arabic and English, fully translated, audited.
- Official logo and brand colours installed.
- Deployed on GitHub Pages from this branch, custom-domain ready without data changes.
- Two maintainability reviews closed with no open findings.

Waiting on the business

● inputs needed

- Phone number and WhatsApp number. The current values are placeholders and show in the header and footer.
- Email address and office address. Rows exist and are hidden until filled.
- Verified social accounts. Five slots exist and are hidden until filled.
- Privacy, terms and the other policy pages. Links exist and are hidden until each page exists.
- Vector logo master and an official reversed lockup for dark surfaces.
- Real photography. Every image slot reserves its aspect ratio, so adding photos shifts nothing.
- Legal entity details for structured data.

Next stages

○ not started

- Stage 11 · Booking flows. Search architecture, cards, status and state components are in place; the booking header and footer variants are built.
- Stage 12 · Customer account. The header's session seam already switches guest and customer menus.
- Supervisor and admin surfaces. Kept as separate systems by design; roles and permission checks are defined.
- Services, destinations, offers and help pages. Menu links currently land on the branded 404.

One thing to act on now: the phone and WhatsApp placeholders are visible to visitors. Supplying the real numbers is a single edit in the navigation data and updates the header and footer together.

Codebase at a glance

Sizes are on disk, uncompressed, before the server applies gzip. Fonts are subset by script and weight, so a page loads only the faces its text needs.

AREA	FILES	SIZE	NOTES
Pages	index.html · styleguide.html · 404.html	3	Header and footer mounted by script on each
CSS	14 layered files behind one <code>foundation.css</code>	135 KB	Cascade layers, logical properties, heavily commented
JavaScript	15 modules: core, data, components, style guide	182 KB	No framework, no bundler, no dependencies
Fonts	IBM Plex Sans Arabic and Inter, 4 weights each	477 KB	Self-hosted subsets; Arabic and Latin faces total 257 KB
Brand	4 logo variants, favicon, touch icon, share image	476 KB	Raster, derived from the supplied JPEG
Icons	One SVG sprite, 58 symbols	10 KB	Fetches once and injects
Docs	FOUNDATION · NAVIGATION · FOOTER · READMEs	5	Decisions recorded with the reasons
Tools	<code>tools/i18n-audit.mjs</code>	1	Language audit, exits non-zero on any miss

Rules every later stage inherits

These are written into the documentation and, where possible, enforced by the code or a check rather than by discipline.

1. **Fully translated, both ways.** A stage is not done until the language audit reports zero untranslated strings on every page it touches.
2. **No invented business information.** Contact, social and legal rows cannot render without a real value. Nothing plausible-looking is faked.
3. **One primary action per screen.** The suites count visible red buttons and fail on more than one.
4. **Consume tokens, never hard-code.** No hex, pixel or duration inside a component.
5. **Logical properties only.** There is no RTL stylesheet to maintain.

- 6. **Data-driven surfaces.** Navigation, services, statuses and search scopes are records an admin panel can own later.
- 7. **Every dynamic region has five states.** Default, loading, empty, error, success.
- 8. **Supervisor and admin stay separate.** The customer header never merges their navigation.
