Verification

Chromium, 390 / 834 / 1440 (+600 / 1024 / 1200)

1. Executive summary

Stage 10 delivered the complete public website of Number One Travel & Tourism on one visual and technical foundation: a design system, global header and footer, the homepage, services and service details, destinations, offers and packages, the booking entry, public supervisor profiles, a responsive and accessibility refinement pass, and a final quality gate. A code-quality review then removed dead and duplicated code and restructured the modules in five gated commits. Every stage was verified in a real browser at three viewport widths in both languages before it was marked built.

JavaScript per customer
page after cleanup

What the site does today. A customer arrives in Arabic or English, reads what Number One sells (13 services, 11 destinations, 3 placeholder offers), chooses a service on the booking entry, describes the trip (flights round trip, one way or multi-city; hotels; visas; packages; Umrah; medical; transport; other) and reaches a validated booking context that Stage 11 will turn into results. A supervisor's public profile puts a person inside the same journey, and the supervisor's identity travels with the customer for the whole session.

What it does not do yet, on purpose. No search results, product pages, payment or accounts (Stage 11–12), no supervisor dashboard or commissions (later stages), and no business facts that the business has not supplied: no phone numbers, prices, photographs, ratings or statistics appear anywhere.

3. Scope delivered, stage by stage

Stage	Deliverable	What it contains	Routes
10.1	Website foundation	Design tokens (colour sampled from the official logo, 14-step type scale, spacing, radius, shadow, motion), layered CSS, DOM and i18n runtime, 61-icon sprite, button / form / card / status / state systems, living style guide, RTL/LTR by logical properties only.	<code>styleguide.html</code>
10.2	Global header & navigation	Data-driven primary nav with mega and dropdown menus, help panel, account entry, language switch, one red "Book now", mobile drawer (focus-trapped, lazy-built), scroll state, keyboard model (click to open, arrows, Escape, Tab into an open panel).	every page
10.3	Global footer	Marketing, booking and app variants; columns from data; phone accordions; contact channels render only when a real <code>href</code> exists.	every page
10.4	Homepage	Editorial hero with the booking widget, services grid with progressive disclosure, values, "help me choose" priorities, destinations, offers, four-step journey, human + digital support, final CTA.	<code>/</code>
10.5	Services	The one service registry (13 services, 4 categories, search / request / manage kinds), category navigation, kind legend, help-me-choose options, journey.	<code>services/</code>
10.6	Service details	One template, thirteen generated routes: breadcrumb, hero with one dominant action decided by the record, overview, features, benefits, steps, requirements, related, support, CTA band; skeleton / unknown / missing-content / error states.	<code>services/<slug>/</code> ×13
10.7	Destinations	The one destination registry (11 destinations, 6 regions, 6 purposes), search with results, deck, regions, featured, purpose tiles; no "best" or "popular" claims by design.	<code>destinations/</code>
10.8	Offers & packages	Listing with category chips, live filters and a phone filter sheet; detail template with inclusions, itinerary, terms, FAQ, flow; three placeholder records that say "request price" instead of a number.	<code>offers/</code> , <code>offers/<slug>/</code> ×3
10.9	Booking entry	Select service → define need → continue: eight service cards, data-driven forms (trip types, multi-city legs, family traveller picker, rooms, cabin incl. first), validation with associated messages, loading / success (context summary) / error / empty states, session-persisted booking context and continue URL for Stage 11; every "book" door on the site lands here.	<code>book/</code>

Stage	Deliverable	What it contains	Routes
10.10	Supervisor profile	The one supervisor registry (five placeholder records, personal fields null until supplied), profile hero "Number One + a person", about facts, attributed service cards, trust, verified-channels-only contact, discovery, states; supervisor attribution stored for the session and carried in every booking context.	<code>supervisor/<slug>/</code> ×5
10.11	Responsive & accessibility refinement	Cross-site audit tool (overflow, clipping, targets, names, labels, headings, landmarks, aria references, contrast, focus rings, header controls, reduced motion); fixes at token / component level: 40px small controls, header at the desktop line, Tab into open menus, reduced-motion scrolls.	all 28 pages
10.12	Final QA gate	Full regression, link check, SEO head check, security-aware review, performance review; layout shift removed (CLS ~1.0 → <0.002), two dead links fixed, photography pipeline prepared, status recorded.	all 28 pages
—	Code-quality cleanup	Five gated commits: versioned tests, deletions, consolidation, restructuring, housekeeping (section 6).	—

4. Architecture

A static site with no build step and no framework: plain HTML shells, layered CSS, native ES modules. Content is data, components draw it, pages compose components. Every list a customer sees comes from one registry per domain, which is also the contract the future admin system will edit.

Data → components → pages

- **Data** — `config` (tokens of behaviour, search verticals, routes), `services`, `service-details`, `destinations`, `offers`, `supervisors`, `navigation`, `footer`, `home`, `images` (generated map).
- **Core** — `dom`, `i18n` (Arabic with the page, English on demand), `format`, `booking` (context, validation, attribution).
- **Components** — ui primitives, cards, search widget, states, brand, session, menus, drawer, header, footer, and one module per page.
- **Pages** — each shell is a short `mountPage()` call importing only its own component; 21 route shells are generated by `tools/build-routes.mjs`.
- **Preview** — Stage 11/12 shapes (flight, hotel, package, trip and supervisor cards, OTP, upload, samples) loaded only by the style guide.

Hand-offs ready for later stages

- **Booking context** — one flat object (service, trip type, route, legs, dates, travellers, rooms, cabin, options, attribution, locale) validated on the client, persisted in session storage and encoded into the `search/` continue URL.
- **Supervisor attribution** — `?supervisor=<slug>` on any door is validated against the registry, stored for the session, shown on the booking entry and written into every context; commission logic is deliberately absent.
- **Registries** — add, edit, deactivate a record and re-run the route generator; no presentation code changes.
- **Photography** — every slot has a key; one command fills them with licensed stand-ins and writes credits.

5. Verification and quality gates

Each stage was verified in Chromium at 390, 834 and 1440 pixels in Arabic and English before being marked built. The final gate re-ran everything on the final code, plus intermediate widths, a link check across every page in both languages, an SEO head check, and the cross-site accessibility audit.

Suite	Covers	Result
Site foundation	tokens, sprite, direction, headings, alt text, icon names, both pages × three widths	96/96
Header interaction · responsive	menus, keyboard model, search door, account, drawer, scroll state; three widths	16/16 · 42/42
Footer	variants, accordions, channels, legal, both languages	62/62
Homepage	structure × widths × locales, validation, help-me-choose, states, keyboard, drawer	170/170
Services · Service details	registry, category nav, deep links; every detail route, full-record template, states	146/146 · 470/470
Destinations · Offers	search, regions, purposes, deep links; filters, phone sheet, sorting, every offer route	165/165 · 170/170
Booking entry	selector, trip types, legs, travellers, every validation rule, states, deep links, context, continue URL	236/236
Supervisor profile	hero, facts, attributed doors, contact, states, full record, attribution hand-off into booking and homepage	182/182
Motion & keyboard	every overlay with and without reduced motion: focus in, no trap, Escape, focus return	27/27
Links & heads	every link on 28 pages × 2 languages resolved; title, description, canonical, lang, dir, one h1	0 problems
Language audit	every visible string on 28 pages in both languages	0 untranslated
Accessibility audit	28 pages × 6 widths × 2 languages: overflow, clipping, 40px targets, 12px text, alt, names, labels, headings, landmarks, ids, aria refs, WCAG AA contrast, focus rings, header controls, reduced motion	0 findings

The final matrix

	Arabic (RTL)	English (LTR)
Desktop 1440	✓ visual · navigation · interaction · responsive · accessibility · language · console · states	✓
Tablet 834	✓	✓
Mobile 390	✓	✓

Reviews with no change needed

- **Security-aware.** Elements are built from text nodes; the only `innerHTML` injects the same-origin icon sprite. URL parameters are matched against registries or data-driven controls, never rendered raw. No credentials, keys or personal data in the repository.
- **Business-data safety.** No phone, WhatsApp, email, address, social account, price, rating, statistic or certification appears; the audit greps every page for them. Channels render only from a set `href` ; placeholder offers and supervisors say so.
- **SEO / structure.** Unique bilingual titles, descriptions, live `lang` and `dir` , one h1, no heading jumps, landmarks, canonical and `og:url` on every public route, a custom 404 that routes back.

6. Code-quality cleanup

A review of the finished codebase found four structural debts rather than litter. They were paid in five commits, each gated by the full suite.

Phase	Change	Effect
0	The thirteen browser suites versioned under <code>tests/</code> with a runner that serves the repository like GitHub Pages; <code>package.json</code> with Playwright as the only dev dependency.	the safety net is in the repository; <code>npm test</code> runs it
1	Dead exports, the unused role model, four strings and 45 CSS classes nothing referenced.	–87 lines of CSS, smaller API surface
2	One page runtime (<code>page.js</code>); shared route graphic, section head, page head and not-found helpers; one <code>bookingEntry()</code> behind every door; the <code>SERVICES</code> alias (an import cycle) removed.	27 inline shell scripts collapsed into one runtime; 13 duplicate helpers gone
3	Preview layer for Stage 11/12 parts; strings split per language and loaded on demand; the 690-line header split into brand, session, menus, drawer and the bar.	JS per page 437 → 239–294 KB, CSS 177 → 158 KB
4	Interim header search sheet removed (the search action goes straight to the page's form or the booking entry); ten stage documents merged into one; status PDF regenerated from the QA record.	one search entry, four documents instead of thirteen

Runtime code delta across the five commits: 43 files, 2,565 lines added, 2,628 removed. Nothing a customer could see changed except the search action, which now lands directly where the old sheet used to send it.

7. Performance

Measure (homepage, desktop)	Before cleanup	After cleanup
JavaScript transferred	437 KB	269 KB
CSS transferred	177 KB	158 KB
Cumulative layout shift	1.0 before the 10.12 gate, then <0.002	<0.002

Measure (homepage, desktop)	Before cleanup	After cleanup
Failed or duplicate requests	0	0
Fonts	IBM Plex Sans Arabic (Arabic + Latin subsets, four weights) and Inter for data; preloaded, <code>font-display: swap</code>	

The site has no bundler, so the number of module requests per page (about 60 with fonts and the sprite) did not fall with the bytes. A build step that concatenates modules would be the next lever if it is ever needed; it is not required for the current traffic profile.

8. Business inputs still needed

Everything below is a field on a data record or a one-command step. Nothing was invented in its place.

Input	Where it goes	Until then
Photography	<code>node tools/fetch-images.mjs</code> on a machine with internet access fills all 28 slots in <code>tools/images.manifest.json</code> with freely licensed Wikimedia Commons stand-ins, writes <code>assets/images/CREDITS.md</code> and regenerates the image map. The build sandbox's egress policy blocked every image host, so this could not run here.	neutral placeholders that reserve the exact aspect ratio
Contact channels (phone, WhatsApp, email)	<code>data/navigation.js</code> and <code>data/supervisors.js</code>	channels hidden; help centre link shown
Real offers (programme, price, dates, inclusions, terms, FAQ)	<code>data/offers.js</code> , one record each	"request price", sections hidden
Supervisor details (name, photo, title, bio, languages, expertise, channels, slug)	<code>data/supervisors.js</code> , then <code>npm run routes</code>	neutral "Number One supervisor" profile
Legal entity, social accounts, office address	footer data and JSON-LD slots	omitted
Airport / city list; booking engine or supplier	the place fields' autocomplete; the <code>prepare</code> seam in <code>mountBooking</code>	Stage 11

9. Known limitations and next stages

- **Stage 11 — Booking engine.** Search results, product pages, traveller details, review, payment, confirmation. Consumes the booking context; the preview cards are its starting shapes.
- **Stage 12 — Customer account.** Sign-in, trips, documents; the account menu and trip card shape already exist.

- **Stage 13 — Supervisor dashboard.** Reads the attribution the profiles already write; commission rules belong here.
- **Stage 14 — Admin.** Edits the registries this site already reads; the role model was removed as unused and returns with the first stage that has a session.
- **Planned routes that 404 today** (each reached only from a labelled link and landing on the branded 404):
[search/](#) , [hotels/<id>/](#) , [packages/<id>/](#) , [trips/](#) , [account/](#) , [account/sign-in/](#) , [account/sign-up/](#) ,
[supervisors/](#) , [destinations/<slug>/](#) , [help/](#) , [help/faq/](#) , [help/contact/](#) , [about/](#) .

Appendix A — Public routes (28)

[/](#) · [404.html](#) · [styleguide.html](#) · [services/](#) · [services/](#) {flights, hotels, visa, packages, umrah, transport, groups, medical, study, work, ticket-issue, ticket-change, ticket-cancel} / · [destinations/](#) · [offers/](#) · [offers/](#) {istanbul-family, umrah, dubai-break} / · [book/](#) · [supervisor/](#) {supervisor-1 ... supervisor-5} /

Appendix B — Commits of the programme

Commit	Subject
b75c050	Stage 10.1: Website master foundation
79e1706	Install the official logo and the brand colours sampled from it
206a149	Stage 10.2: global header and navigation system
17e2c38	Stage 10.3: global footer
e6a0503	Make every page fully translated in both locales and add an i18n audit
3dea4eb	Stage 10.4: production homepage
62c0034	Stage 10.5: services page and the one service registry
bf2de37	Stage 10.6: service detail pages — one template, thirteen routes
b19300c	Stage 10.7: destinations page and the one destination registry
3716a0c	Stage 10.8: offers and packages — listing, detail template, one registry
1d3e004	Stage 10.9: booking entry — /book/ with service selector, data-driven forms and the booking context
8b42cde	Stage 10.10: supervisor profile — supervisor/<slug>/ on one registry, with booking attribution
78ea3a6	Stage 10.11: responsive and accessibility refinement
4531460	Stage 10.12: final QA gate — layout shift removed, dead links fixed, photography pipeline
ad3a08e ... d195417	Cleanup phases 0–4: versioned tests and runner · deletions · consolidation · restructuring · housekeeping

Appendix C — How to run the checks

Command	Does
<code>npm install</code> (once)	installs Playwright, the only dev dependency
<code>npm test</code>	serves the repository like GitHub Pages, runs all thirteen suites, then the language and accessibility audits
<code>npm test -- home booking</code>	only the named suites
<code>npm test -- --audits</code>	only the two audits
<code>npm run routes</code>	regenerates the 21 route shells and the sitemap after a registry change
<code>npm run images</code>	fills the photography slots (needs internet access to Wikimedia Commons)
