

Stage 10 — Final QA & Verification (10.12)

نمبرون للسفر و السياحة · Number One Travel & Tourism

Status: **STAGE 10 — COMPLETE / BUILT + VERIFIED**

QA date	2026-09-16
Viewports	390 · 834 · 1440, plus 600 · 1024 · 1200 for breakpoint checks
Languages	Arabic (RTL, default) · English (LTR, live switch)
Pages	28 — home, 404, style guide, services, 13 service details, destinations, offers, 3 offer details, booking entry, 5 supervisor profiles
Browser	Chromium (Playwright), served from the same sub-path as GitHub Pages

Scope verified

STAGE	VERIFIED BY	RESULT
10.1 Foundation	site suite (tokens, icons, sprite, dir, h1, alt, names)	96/96
10.2 Header & navigation	interaction + responsive suites, motion/keyboard pass	17/17 · 42/42
10.3 Footer	footer suite	62/62
10.4 Homepage	homepage suite	169/169
10.5 Services	services suite	146/146
10.6 Service details	detail suite, every route, full-record template	470/470
10.7 Destinations	destinations suite	165/165
10.8 Offers / packages	offers suite, every route	170/170
10.9 Booking entry	booking suite	236/236
10.10 Supervisor profile	supervisor suite, attribution hand-off	182/182
10.11 Refinement	cross-site audit (28 pages × 6 widths × 2 languages), motion/keyboard pass	0 findings · 29/29
Language	language audit, 28 pages, both locales	0 untranslated
Links	every link on every page, both languages, resolved against the server	0 dead
Console	every load in every suite and audit	0 errors

The final matrix

	ARABIC	ENGLISH
Desktop 1440	✓ visual · navigation · interaction · responsive · accessibility · language · console · states	✓
Tablet 834	✓	✓
Mobile 390	✓	✓

Each cell is backed by the suites above running at that width and locale; the screenshots reviewed for the visual pass are the suites' own.

Issues found in this gate and fixed

FINDING	ROOT CAUSE	FIX (LAYER)
Layout shift of ~1.0 on every page at first paint	the module script fills the page after the browser has painted the empty shell, so everything moves down when the header and regions arrive	the header's space is reserved by a placeholder built from the same tokens (12-header , every shell); the main column and phone nav stay unpainted until boot() swaps .no-js for .js (04-layout); the phone nav has its token height (07-components). CLS is now < 0.002 on every measured page
Dead link "تحدث مع مختص" on the 404 page	pointed at support/ , which was never a route	help/contact/ (planned help route)
Style guide's sample supervisor card linked to a slug the registry does not know	the sample record predates the registry	samples carry the launch slugs

Reviewed with no change needed

- **Security-aware review.** The only innerHTML in the codebase injects the same-origin icon sprite. Every element is built with el() and text nodes. URL parameters are never rendered raw: ?vertical , ?service , ?category and ?supervisor are matched against registries or data-driven controls, ?to resolves a slug to a localised name, and the profile's public-link field shows the page's own URL as a value. No credentials, keys or personal data exist in the repository.
- **Business data safety.** No phone, WhatsApp, email, address, social account, price, rating, statistic or certification appears anywhere; the audit greps for them on every page. Channels render only from a set href ; placeholder offers say "request price"; supervisor records are null until supplied.
- **Performance.** One CSS bundle (177 KB across 22 layered files), one JS module graph (437 KB uncompressed, no dependencies, no bundler), the icon sprite, fonts preloaded with font-display: swap ; 62–65 requests per page, no failed or duplicate requests, three images or fewer per page (all brand assets). Photography slots stay neutral until filled.

- **SEO / structure.** Every page has a unique title in both languages, a description, `lang` + `dir` set live, one `h1`, no heading jumps, landmarks (`header` , `nav` , `main` , `footer`), canonical + `og:url` on every public route, and a custom 404 that routes back to the services.
- **Code quality.** No duplicate CSS or JS was introduced in Stage 10; the refinement helpers (`scrollTo` , the audit tools) each exist once. The data → components → pages architecture is intact.

Planned routes (future stages, 404 today by design)

`search/` (Stage 11 results) · `hotels/<id>/` , `packages/<id>/` (Stage 11 products) · `trips/` , `account/` , `account/sign-in/` , `account/sign-up/` (Stage 12) · `supervisors/` (listing) · `destinations/<slug>/` (detail pages) · `help/` , `help/faq/` , `help/contact/` , `about/` . Each is reached only from a labelled link and lands on the custom 404, which explains and routes back. No content was invented for them.

Remaining business inputs

- **Photography.** The sandbox's egress policy blocks every image host (Wikimedia Commons, Unsplash, Pexels), so the free stand-ins the business asked for could not be downloaded here. The pipeline is ready: every slot has a key in `tools/images.manifest.json` , the data reads `data/images.js` , and `node tools/fetch-images.mjs` on a machine with internet access fetches freely licensed photographs, writes the credits and regenerates the map. Then commit `assets/images/` and the map.
- Contact channels (phone, WhatsApp, email) — `data/navigation.js` , `data/supervisors.js` .
- Real offers (programme, price, dates, inclusions, terms) — `data/offers.js` .
- Supervisor details (name, photo, title, bio, languages, expertise, channels) — `data/supervisors.js` .
- Legal entity details, social accounts, office address — footer and JSON-LD slots.
- Airport / city list for the place fields, and the booking engine the `prepare` seam calls — Stage 11.

Known limitations belonging to later stages

Search results, product pages, traveller details, payment and confirmation (Stage 11); customer account and trips (Stage 12); supervisor dashboard, commissions and the admin system that edits the registries (later stages). The booking context and the supervisor attribution built in 10.9 and 10.10 are the hand-offs those stages consume.
